The transformation of government contracting.

Cora PPM for Regulated Industries

Cora

It's time to say goodbye to silos.

How many regulations did you run into today? How many restrictions and redundancies? How many hoops did you jump through, trying to coax costs, compliance controls, and schedules from their siloed systems?

As a government contractor, you might accept these obstacles as just another part of your job—much like the decades-old platforms you may still be forced to use.

But how would you like to push past those legacy systems and beyond yesterday's mindset? What if you could restructure programs how they *should* be run and how government projects *could* be delivered? What if you had real-time visibility into performance data—with compliance built into the process? Or if you had better technologies, best practices, and the capacity to turn both into breakthroughs?

You have it all with Cora,
and it's time to move forward.

One platform.
Full oversight.

Cora is the first fully integrated platform to unify cost, schedule, risk, and traceability in one connected platform—with no workarounds, no manual reconciliation, and no lag.

It replaces the old patchwork of disconnected platformss with real-time oversight, giving leaders the clarity to act, the control to adapt, and the data to defend every decision. It's not just better visibility. It's a fundamentally better way to run programs.

With Cora, you have a common-sense platform to fix all-too-common complexities.

Stop the multi-platform mayhem.

Eliminate the need for multiple scheduling, cost, EVM, and reporting tools—delivering a single, integrated system that does the job faster and smarter.

Gain resource visibility across your entire portfolio.

Whether your team uses homegrown systems or is fully reliant on MSP, Cora can aggregate all project schedules into a single integrated master schedule (IMS). This will help you uncover capacity planning issues for existing projects, as well as plan for future award impact.

Put easy EVM and IPMDAR in one place.

Generate earned value metrics and IPMDAR reports directly from your program data. That means no spreadsheets, no messy data transformation, no exports, no reconciliation cycles, and no waiting to close out each month and certify project information.

Enjoy instant integration, from WBS to audit trail.

Make sure every change, risk, and resource are tracked in real time with full vertical and horizontal integration built in. So nothing gets lost and everything adds up.

Deliver clarity for every role, from CAM to exec.

Configurable dashboards give CAMs, PMs, and executives clear insight into the info they need. And it's all based on the same source of truth.

Know your system is built for decisions—not just documentation.

Connect every metric and track every milestone, so program leads spend less time compiling and more time leading.

Structured for your success.
Built for your progress.

"Shaking things up" can be a very good thing, but is disrupting your processes really worth the hype and headache?

What if you could transform how much gets done without disrupting how you do things?

Cora improves program performance without disrupting how your teams work.

By wrapping around your existing contracts, governance models, and reporting cadence, Cora streamlines execution, reduces overhead, and brings structure to chaos. It's not about replacing your process. It's about making it stronger. This means you can:

Work the way you work—just better.

Wrap our system around your existing processes, governance models, and reporting cadence, and you can keep what works while eliminating inefficiencies and bottlenecks.

Be ready for real-world complexity.

With built-in support for CLIN structures, contract types, subcontractors, and layered review processes, the Cora platform is designed for the realities of how government programs actually run.

Streamline execution across teams.

Automate reviews, trigger next steps, and flag blockers with built-in workflows and configurable approvals. So projects move forward without micromanagement.

Standardize without slowing down.

Cora helps you apply structure across programs without stifling flexibility. You can enforce consistency where needed, while still being able to adapt to the nuances of each project or contract.

Deliver proven performance with fast deployment.

Get up and running in months, not quarters. Your teams will see value quickly, and no one has to wait on long, complex rollouts or forced process overhauls.

Engineered for compliance. Built for leaders.

Compliance shouldn't be a burden, but when's the last time you felt anything but overwhelmed by it?

Cora doesn't work that way. From EVM and IPMDAR to FedRAMP security and DCMA alignment, Cora automates oversight and embeds compliance into everyday workflows—delivering faster reporting, cleaner audits, and programs that run smoother because they're built to meet the rules from day one.

Be confident in built-in compliance, not bolted-on extras.

Align with government frameworks right out of the box—from FAR and DFARS to ANSI/EIA-748 standards—so compliance is a natural part of your process, not an extra layer to manage.

Streamline monthly EVM processing.

Connect performance data directly to schedule and budget baselines, so you can calculate earned value and submit reports without days of data manipulation or platform-jumping.

Choose from multiple deployment options.

These cloud or on-premise options meet rigorous cybersecurity standards for government programs, ensuring secure data flow without compromising usability.

Be audit-ready from day one.

Automatically track and control account activity, baseline changes, and variance narratives. It's a full audit trail that's always up to date and easy to trace.

See compliance at scale, across portfolios.

Support compliance across large, complex program portfolios—enabling consistent reporting, repeatable processes, and streamlined oversight from the ground up.

A transforming workforce needs a transforming platform.

As your team grows and changes, people take inherent knowledge with them, and new talent comes in with new ideas. You need tools that adapt to those changes as they happen—protecting priviledged information and continually improving processes.

It's time to transform.

We're not talking about making waves, we're talking about making sense—making sure project portfolio management lives up to a new set of standards instead of limping along with the status quo.

It's about redefining what you can do, as well as how much more you can get done. It's about recrafting PPM systems to meet tomorrow's requirements, not merely today's.

And if that sounds like we're reshaping the future of government contracting, that's because we are.

Are you in?
